Drilled Shaft Radius, Volume and Verticality Services with SHAPE

Benefits of SHAPE
- Quickly determines the shaft verticality, radii, shape, and drilled hole volume in water, polymer, and mineral slurries using the SHAPE device attached to the drill rig’s Kelly bar
- Timely analysis and reporting provided by an on-site or remotely connected GRL engineer
- Provides 3-Dimensional, 360° view of the drilled hole

What Is SHAPE

GRL Engineers, Inc., offer SHaft Area Profile Evaluator (SHAPE) services to measure and report the characteristics of a wet pour, drilled shaft excavation. The SHAPE device uses eight ultra-sonic signals to scan the sides of an excavated drill hole. GRL Engineers SHAPE service provides a quick check of the drilled shaft verticality, radii, shape, and drilled hole volume. During a test, collected data is stored within the SHAPE device’s internal memory allowing for cable free data collection.

Test Procedure

Once the SHAPE device has been quickly connected to a drill rig’s Kelly bar, it is positioned over the center of the drill hole. The SHAPE device is then lowered into a water or slurry filled hole, while simultaneously collecting data from all sensors as it is lowered or raised, at a rate of up to one foot per second. Following removal of the SHAPE device from the drilled shaft excavation, the device is connected via ethernet cable to the SHAPE Tablet where the collected test data is downloaded, processed, and displayed. This can be done in real time with a GRL engineer on-site, or it can be done remotely with the engineer connected to the SHAPE Tablet via the internet.

Data Analysis and Reporting

Drilled hole profiles of radius vs depth are checked and presented for each diametrically opposite pair of sensors. From the diameters calculated at the top and bottom of the drilled hole the verticality, as well as the offset in a x and y direction, can be determined. The theoretical and measured volume of the excavated shaft can also be compared as a function of depth.
Drilled hole profiles corresponding to each sensor pair

Maximum verticality and offset value in x and y directions

3-D Plot

The drilled hole can also be visualized in a 3-Dimensional plot that rotates to provide a 360° view of the drilled hole. This 3-D plot can be used to assess the verticality and change in radius along the drilled hole depth. At any selected depth (indicated by the red horizontal line), the radius and the offset (eccentricity) can be calculated and reported with reference to the top of the drilled hole.

For additional information on Drilled Shaft Radius, Volume or Verticality Services, or any other GRL Engineer service, please contact info@GRLengineers.com or visit us at www.GRLengineers.com.
